Applications for Linear-Roundrail-Technology-Products:

- food industry
- printing machines
- packaging machines
- medical industry
- optical scanner
- robots
- textile industry
- semiconductor industry
- woodworking machines
- handling systems

Linearguidings are used to solve linear movement requirements in various fields of engineering and machine building. As they contribute significantly in designing a machine technically and commercially, linearguidings gained in importance these days.

This catalogue introduces powerful linear-roundrail-components, mainly precision shafts, linear ballbushings, linear slidebushings, linear housing units and construction components, in 5 chapters.

Besides the mentioned standard-components, also special designs are available. These will be manufactured following a customer-drawing or will be designed based on given technical parameters.

We will be pleased to support you with our knowhow and experience.

The interpretation and application of information in this catalog are for illustration purposes only. The responsibility for the use of the products of this catalog lies solely with the designer or user. Despite all care, errors can not be ruled out.

Technical Considerations

Temperature and Friction

The temperature range, these linear ball bearings are suitable for applications between -20 and +80°C. For higher temperatures we recommend all-steel bearings with special lubricants.

The coefficient of friction depends on the quality of the seals as well as on pressure and lubrication. The linear bearings have a Coefficient of Friction of 0.001 to 0.005.

Construction, Design and Materials

Linear housings - aluminium extruded section

Housing units can be fitted with all the linear bearings contained in this catalogue. Aluminium housings are made of alloy EN AW-6060 or EN AW-6082.

Linear-housings - graphite pellet / aluminium injection mouldings

These housing units consist of standard or linear ball bearings with angle error compensation, slide bushings and cast iron- or aluminium injection moulding housings.

The bores for accepting linear ball bearings are generally H7.

Further tolerance information is given elsewhere in this catalogue.

Assembly Notes

The linear ball bearings mentioned in this catalogue are designed for bores to tolerance H7. They can be retained by retaining rings or clips. Open bearings are held in the radial-axial fixing bore by means of screws, dowels or lubricating slotted screws (page 11).

Standard linear ball bearings can also be pre-loaded with JS6 to M6 tolerances.

Open Linear Ball Bushings are supposed to be used on shaft support (load from above).

If a linearguide with reduced clearance is needed, we recommend to use radial adjustable linear ball bushings. The radial clearance will be reduced by using a screw until a certain resistance is noticed when turning the shaft. The adjustment should be done in stages. If too much preload will be applied the shaft or ballbushings can be damaged.

Please contact our technical office in case of non standard assembly configurations to confirm whether or not the linear units are suitable for your application.

For safety and economic reasons however we strongly recommend the use of preassembled housing units.

Speed and Acceleration

Version	Max. Acceleration	Max. Speed
KH	50 m/s ²	2 m/s
LME	50 m/s ²	3 m/s
SDE	N.A.	N.A.
SPM	150 m/s ²	3 m/s
SSE	150 m/s ²	3 m/s
FMT	N.A.	4 m/s (with intermittent motion)
FM	N.A.	4 m/s (with intermittent motion)

Operating Life and Working Load for Linear Ball Bearings

Working Load

The load conditions listed in the tables apply to the linear ball bearings described in this catalogue in combination with precision steel shafts.

1. The load is applied at 90° to the horizontal plane
2. The surface hardness is HRC 62±2.

The following formula applies to configurations other than those given:

$$W_R = \frac{P}{K_\theta \times K_S \times K_L}$$

W_R = required dynamic load (N)
 P = resultant of externally applied loads (N)
 K_S = hardness factor of shaft
 K = factor for direction of resultant load
 K_L = factor for operating life

Direction of Load

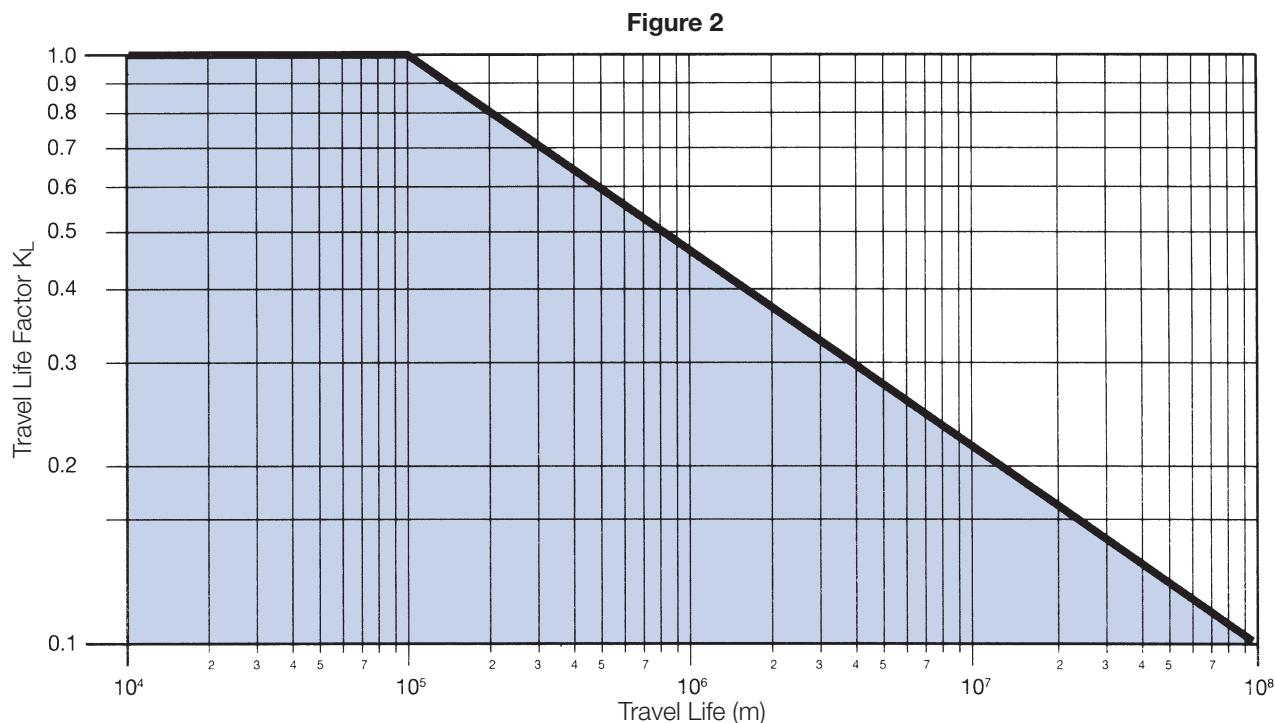

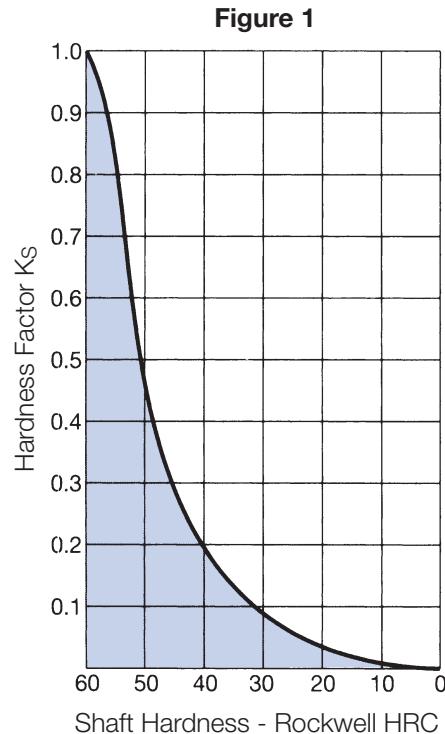

For load correction factor K applicable to any linear ball bearing or linear housing, please enquire.

Shaft Surface Hardness

If a shaft does not conform to the HRC 62±2 criteria, a surface hardness correction factor K_S applies.

Operating Life

The correction factor K_L for operating life expectancy can be obtained from fig. 2.

Technical Considerations

Load Limit

The load limit is the maximum load which may be applied to the bearing. Any application must be analysed in advance in order to ensure that maximum and / or shock loads will not exceed the load limits.

Dynamic Load Conditions

The dynamic load condition refers to the maximum continuous load which may be applied to a bearing, with a 90 % probability that a working life of 100 km can be achieved under normal operating conditions.

However, it must be considered that extremely short strokes, and the direction of load application, are also deciding factors.

The working life can be estimated by the use of the following formula:

$$L_m = \left(\frac{W}{P} * K_\theta * K_S \right)^3 * 10^5 \text{ m}$$

where:

L_m = working life in meters

W = dynamic load condition according to the tables, in N

P = result of the externally applied load, in N

K_θ = direction factor for the resulting load

K_S = shaft hardness factor

Sample Calculations

This shows how to calculate the correct size of ball bushing for a given application. In this example the "bearing shaft system" is subjected to a load of 2300N, acting at right angles to the direction of motion. The load is uniformly distributed among four closed Super-Smart Linear Ball Bearings™. The carriage moves over a stroke of 0.3 m at a frequency of 100 complete cycles per minute. An operating life of at least 3500 hours is required. A precision shaft will be used.

First, the average load acting on each of the Super-Smart bearings must be determined.

$$P = \frac{2300}{4} = 575 \text{ N}$$

From this the working life in m can be found:

$$L_m = 2 * s * f * L_h * 60$$

where: s = stroke in m

$$L_m = 2 * 0,3 * 100 * 3500 * 60$$

where: f = frequency in cycles per min

$$L_m = 1,26 * 10^7 \text{ m}$$

where: L_h = required life in hours

From fig. 2 (graph) the working life factor (K_L) 0.2.

From fig. 1 (graph) the shaft hardness factor (K_S) 1.

For closed Super-Smart Linear Ball Bearings™ the minimum value of K_θ is 1, which is the value used for this calculation.

The necessary dynamic load is determined from the following formula:

$$WR = \frac{P}{K_L * K_S * K_\theta}$$

$$WR = \frac{575}{0,2 * 1 * 1} = 2875 \text{ N}$$

From the appropriate sections giving technical product data and dimensions in this catalogue, it can be seen that the linear bearing with the next higher load capacity is the Super-Smart Linear Ball Bearing™ with a dynamic load capacity of 4000 N.

Determination of Working Life

The expected life of the Super-Smart Linear Ball Bearing™ "SMTE" under the conditions of this example is as follows:

$W = 4000 \text{ N}$ is the stated dynamic load

$P = 575 \text{ N}$ is resultant external load

$K_\theta = 1$ is the orientation factor

$K_S = 1$ is the shaft hardness factor

Die oben genannten Werte werden in die folgende Formel eingebracht:

$$L_m = \left(\frac{W}{P} * K_\theta * K_S \right)^3 * 10^5 \text{ m} = 2.93 * 10^7 \text{ m}$$

The above values are substituted in the following expression:

$$L_h = \left(\frac{L_m}{2 * 60 * s * f} \right) = 8139 \text{ Hours}$$

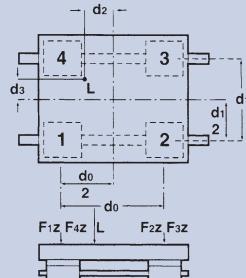

Load Calculation

When designing a linear motion system, the way in which operating variables will influence performance must be considered. The following examples show how the position of the load and the load center can influence selec-

$$\begin{aligned} F_{1z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{2z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{3z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{4z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \end{aligned}$$

Horizontal Application I

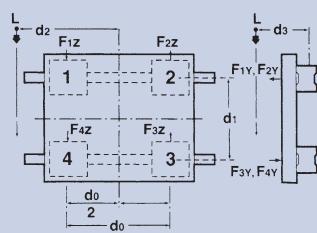

At the time of movement with uniform velocity or at the time of stop.

$$\begin{aligned} F_{1y} \sim F_{4y} &= \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{1z} = F_{4z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} \\ F_{2z} = F_{3z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} \end{aligned}$$

Side Mounted Application

At the time of movement with uniform velocity or at the time of stop.

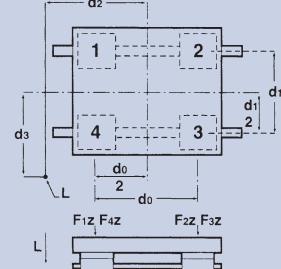

tion of the product. When considering an application, every force acting on the system must be evaluated in order to enable the most suitable product to be selected.

$$\begin{aligned} F_{1z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{2z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{3z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{4z} &= \frac{L}{4} + \frac{L}{2} \cdot \frac{d_2}{d_0} - \frac{L}{2} \cdot \frac{d_3}{d_1} \end{aligned}$$

Horizontal Application II

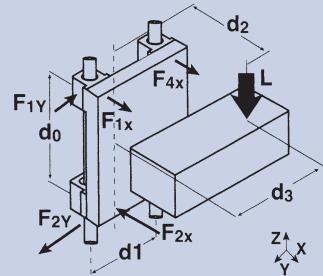

At the time of movement with uniform velocity or at the time of stop.

$$\begin{aligned} F_{1x} \sim F_{4x} &= \frac{L}{2} \cdot \frac{d_2}{d_0} \\ F_{1y} \sim F_{4y} &= \frac{L}{2} \cdot \frac{d_3}{d_1} \\ F_{1x} + F_{4x} &\sim F_{2x} + F_{3x} \\ F_{1y} + F_{4y} &\sim F_{2y} + F_{3y} \end{aligned}$$

Vertical Application

At the time of movement with uniform velocity or at the time of stop. At the time of start and stop, the load varies because of inertia.

Terms:

- d_0 = distance between centerlines of the bearing housings
- d_1 = distance between centerlines of shafts
- d_2 = distance between centerlines of carriage and center of gravity
- d_3 = distance between centerline of carriage and center of gravity
- L = Load (N)
- F_{Nx} = Force in direction of X-axis (N)
- F_{Ny} = Force in direction of Y-axis (N)
- F_{Nz} = Force in direction of Z-axis (N)

Technical Considerations

Shaft Deflection

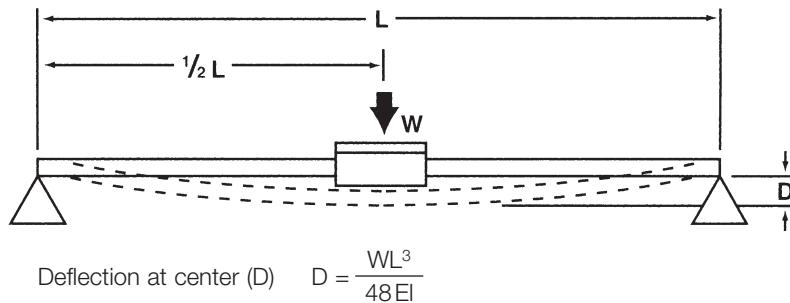

When using hardened precision steel shafts with end supports, care must be taken to ensure that the shaft deflection within the bearing travel does not exceed the bearing performance criteria.

The following tables give the shaft deflection at the center of a shaft with end supports. Systems using fully supported shafts are not subjected to these deflections.

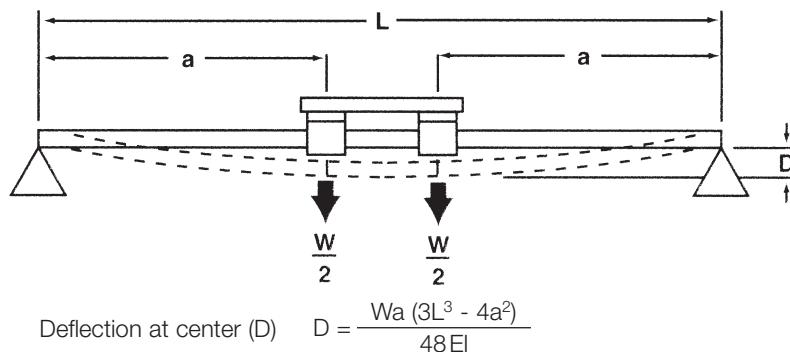

Values of EI for Hardened and Ground Shafts

Shaft Ø (mm)	EI (Nm ²)
5	5,838
8	38,26
10	93,41
12	193,7
16	612,2
20	1.495
25	3.649
30	7.566
40	$2,391 \cdot 10^4$
50	$5,838 \cdot 10^4$
60	$1,211 \cdot 10^5$
80	$3,826 \cdot 10^5$

Simply Supported Shaft with Single Block

Simply Supported Shaft with 2 Single Blocks

D = mm

W = N

L = mm

a = mm

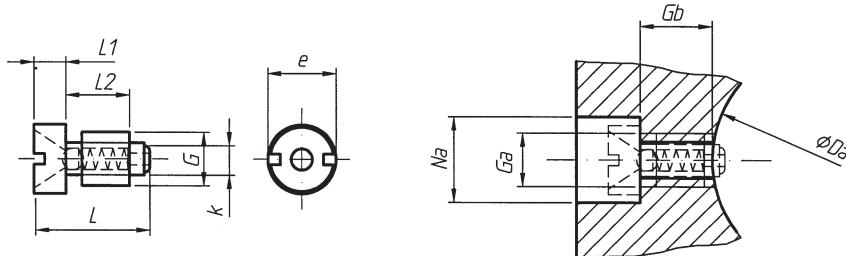

Lubrication

All Linear Guiding Systems must be lubricated to ensure their function. The volume and the way of lubrication depends on the product. The definition of the re-lubrication, in terms of volume and cycles, are depending on the applications and can be calculated by our technical department. The information about grease- and oil-lubrication refer to standard industrial applications and are not obligatory. Especially in special cases, i.e. food-industry, high temperature- or high speed- applications or short-stroke-applications, an investigation of the application is necessary as well.

Delivery condition: All Linear ball bushings are shipped with rust preservative, that protects from corrosion and other influences during transport and storage.

Grease-lubrication: Common. Because of the trend to minimum-volumes and extended lubrication intervals, grease lubrication is useful for linear ball bushings. We recommend Klüber Isoflex NCA15.

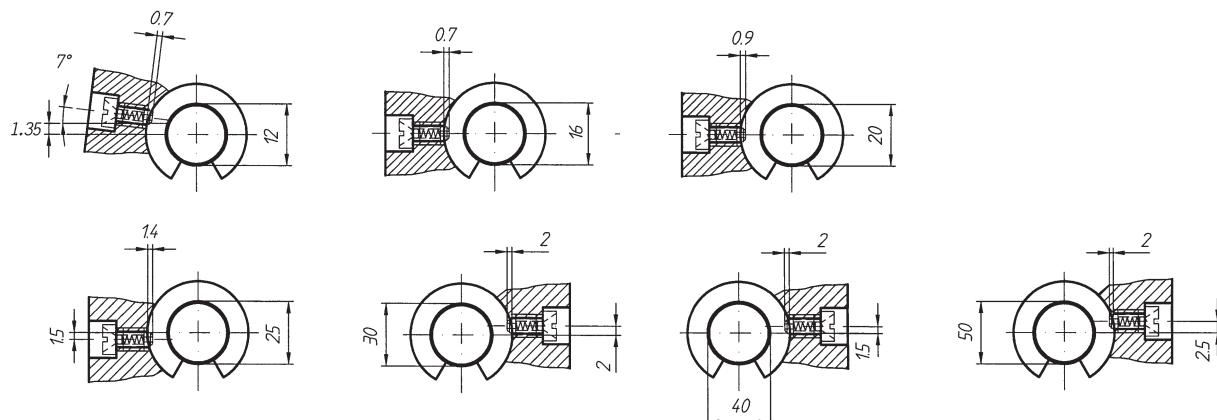

Lubrication nipple - slotted screw

Position of radial - axial fixings

Super-Smart Linear Ball Bearings™

The SSE Super-Smart Linear Ball Bearings™ represent a significant, world-wide advance in linear guide technology. Super-Smart Linear Ball Bearings™ provide double the capacity and 8 times the working life, compared with Super-Smart Linear Ball Bearings used in industry.

Technologically advanced design

With Super-Smart Linear Ball Bearings™, four hardened steel elements carry the bearing forces, (see figs. 1 and 2).

The first element is the steel outer shell, which ensures diameter consistency of the bearing, even for slightly out-of-round housings. The unique design of this ring permits the adjustment of the bearing and provides compensation for diameter variations.

The second element is the high-precision double-track bearing plate, which doubles the load capacity and is self-adjusting.

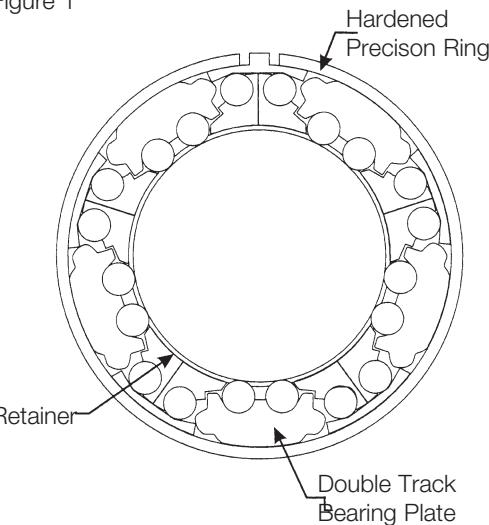

The third element is the rolling components. The Super-Smart Linear Ball Bearings™ are provided with precision-ground balls with roundness and spherical geometry conforming to the highest quality standards. This results in maximal load capacity, working life and efficiency.

The PowerRail Advantage

The PowerRail Advantage is the ability of a Super-Smart Linear Ball Bearing™ to compensate torsional alignment errors due to carrier unevenness, machining inaccuracies or machine distortions, without unduly stressing the bearing. Assembly times and costs are reduced to a minimum whilst the efficiency of the bearing is maximised.

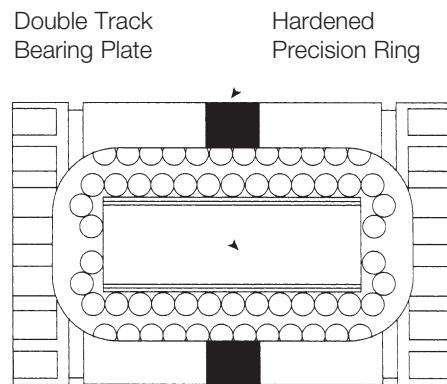

Super-Smart Linear Ball Bearings have 3 times the load capacity and 27 times the working life of conventional linear guides.

Figure 1

Cross-section of Super-Smart Ball Bushing Bearing™

Figure 2

Assembly notice: When sliding the ball bushing on the shaft, the shaft must not twist or be misaligned. Further no improper force may apply to the ball bushing. The assembly sleeve should only be removed during the assembly process.

Universal Self-Alignment

The bearing plate of the Super-Smart Linear Ball Bearing™ embodies many unique and technically advanced features. The universal self-alignment features are responsible for the fact that the Super-Smart Linear Ball Bearing™ achieves optimum performance with regard to load bearing capacity, working life, smooth operation and low coefficient of friction. The self-adjustment process has three features: tilt, roll and rotation.

Tilt

The design of the bearing plate permits it to tilt 0.5° inside the hardened outer shell, (see figs. 3 & 4). This enables a Super-Smart Linear Ball Bearing™ to compensate alignment errors due to housing bores or shaft distortions. This tilting ability also facilitates the smooth entry and exit of the precision balls into and out of the load zone, which results in a constant, low friction coefficient. Whilst compensating alignment errors, each load-bearing ball in the load zone is equally stressed, which results in maximum load capacity.

Roll

The second significant design characteristic of the Super-Smart Linear Ball Bearing™ is the ability to roll. The outer radius of the cage is slightly smaller than the inner radius of the precision outer ring, (see fig. 5). The cage can compensate torsional inaccuracies and distributes the load equally between its two tracks. This roll function provides maximum load capacity and long working life.

Rotation

The ability to tilt and roll enables the cages of the Super-Smart Linear Ball Bearing™ to turn over their center axis, (see fig. 6). This enables the Super-Smart Linear Ball Bearing™ to compensate misalignments, resulting in a constantly low friction coefficient and maximum load capacity.

Figure 3

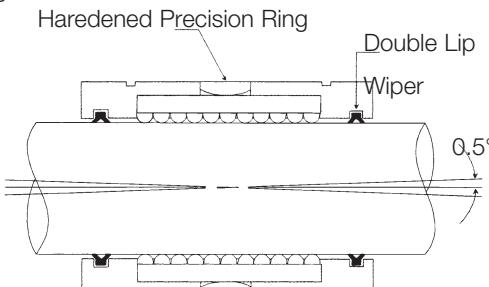

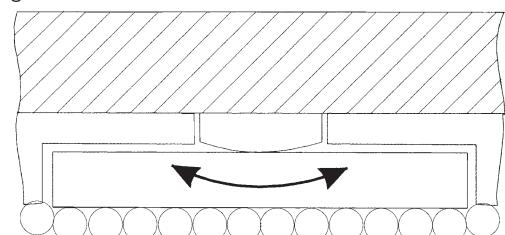

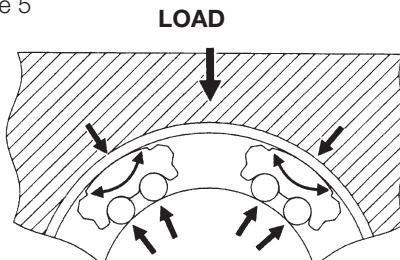

Figure 4

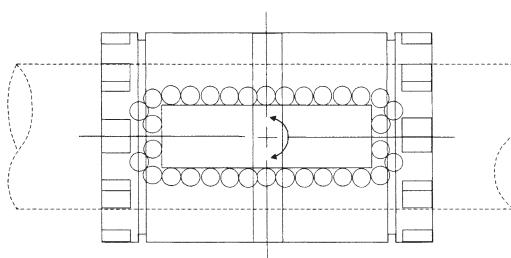

Close-up of hardened precision ring, showing how the bearing plate self-aligns (rocks) about the curved surface of the ring.

Figure 5

Close-up of double track bearing plates showing how they self-align (roll) to evenly distribute the load on each of their two ball tracks

Figure 6

Bearing plates rotate about their centre to prevent skewing relative to the center Linear Race.

Technical Considerations

Precision slide bushings made of Frelon

Frelon® is a composition of Teflon® and additional materials and was developed to create superior performance. Its intention is to ensure less friction, self lubrication, high rigidity and reduced abrasion.

Chemical resistance

Frelon® as a material is almost completely inactive. Only melted Natrium and Fluor under higher temperature effect the material.

Aluminium, anodisation and hardcoating

Precision slide bushings are made from aluminium AlMg1 SiCu. Sulfuric bath anodizing with a nickel acetate seal ensures best corrosion protection, that can be achieved with anodised coatings. Supposed the coating is correct, it is chemically inactive with a pH-value of 5 – 8 in most fluids. Hardcoating offers the same chemical resistance, but will be manufactured with a thickness of 50 µm, which improves the resistance of the surface.

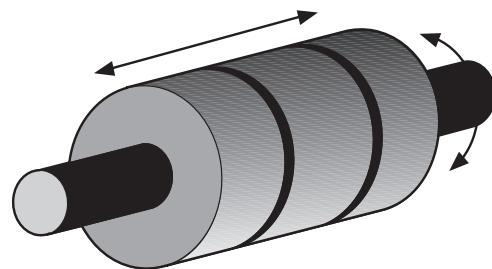

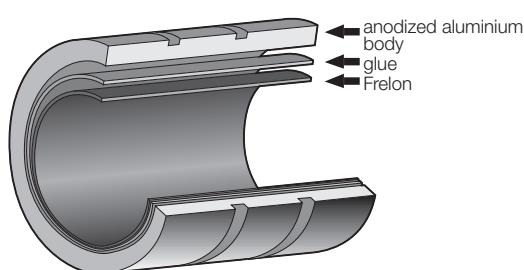

Temperature

Precision slide bushings work in a wide temperature range: -240°C up to +260°C.

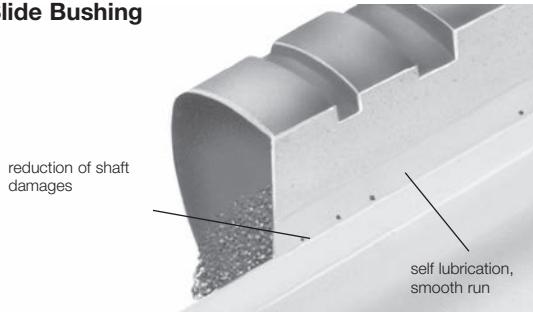

- Linear slide bushings are developed to be implemented into most industrial applications.
- We recommend the standard range (FM-series) for temperature ranges lower than -18°C, whereas FMC-series is recommended in high temperature applications.

In order ensure the correct clearance, it is necessary to check the “real dimensions” when extreme temperatures apply

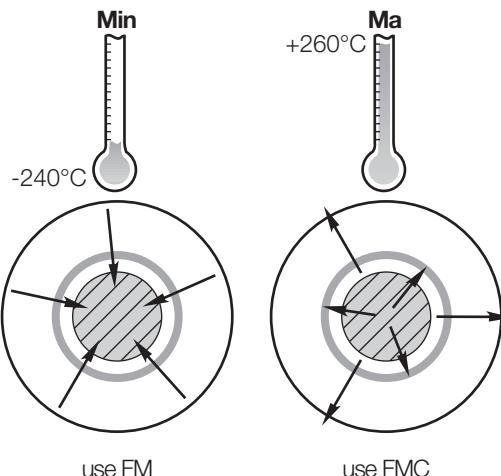

Teflon® is a registered Trademark of Dupont Corporation

Slide Bushing

Temperature ranges

Assembly

The linear ball bearings are manufactured to very tight tolerances and result in smooth, almost frictionless movement. This excellent performance will be achieved only if the bearings are carefully assembled.

The alignment of the bearing and the parallelism of the shaft are the most important factors. To achieve smooth movement, two linear bearings per shaft are normally used. The housings should be carefully aligned as described below. When using tandem bearing housings, such alignment becomes superfluous.

In addition, make sure that the height of the mounting plate surface to the shaft is constant within limits of 0.025 mm. Depending on the accuracy of the mounting surface, it may be necessary to use shims.

The housings can be fitted to the mounting plate as follows:

- a. Mount two housings, align them, and tighten the fixing screws. (Fig. 1)
- b. Mount the second pair of housings on the opposite side of the carriage and screw the fixing screws finger tight.
- c. Push a sample shaft of the correct diameter and tolerance (h6) through this pair of housings in order to align them. (Fig. 2)
- d. After correct alignment of the second pair of housings tighten the fixing screws.

Figure 1

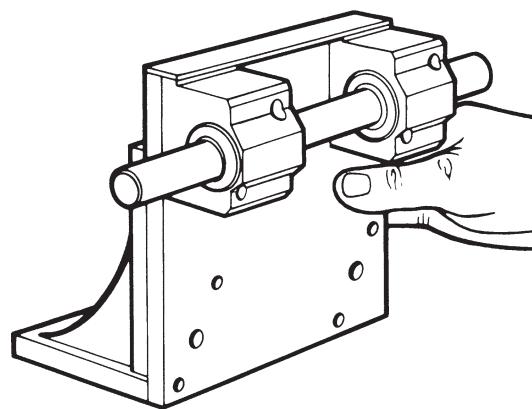

Figure 2

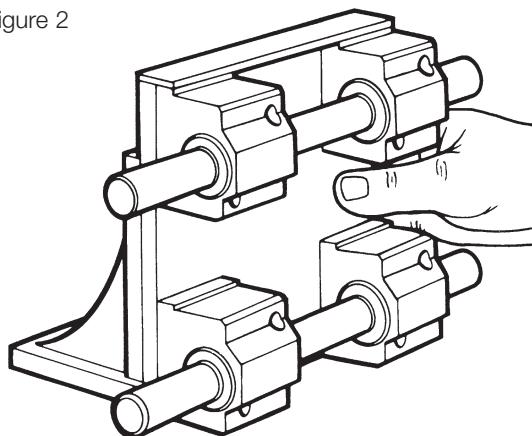

Figure 3

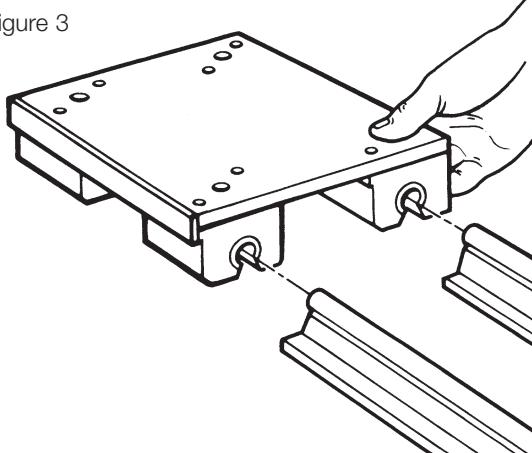

Figure 4

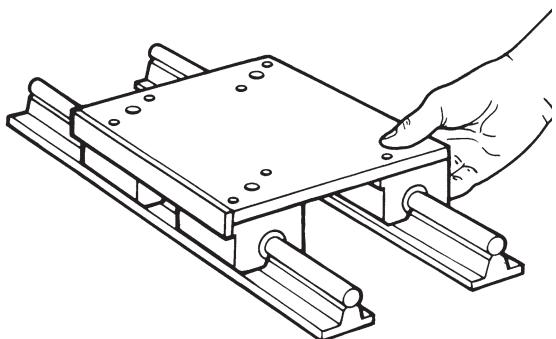

Figure 5

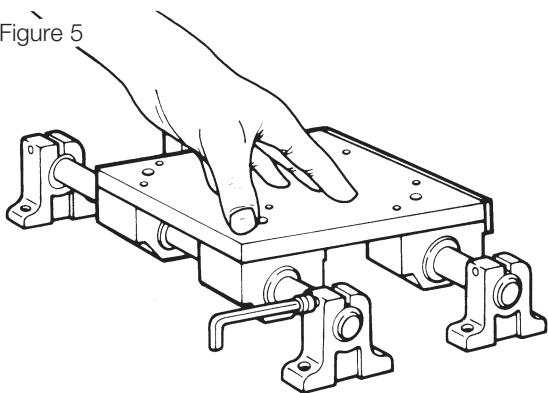

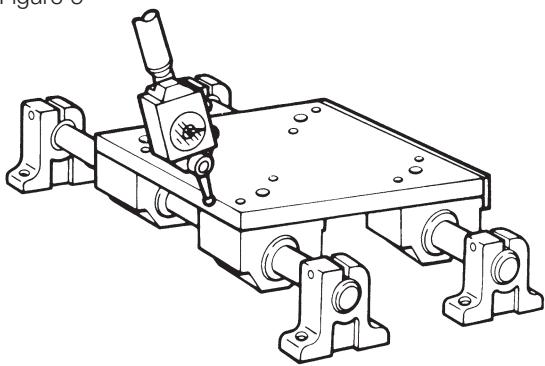

Figure 6

After properly preparing the carriage, the shafts need to be fixed on the mounting plate. To provide smooth running, the shafts must be parallel, with a tolerance of not more than 0.025 mm over the entire length of travel. To achieve this, proceed as follows:

- a. Mount one shaft, either supported at the ends or over the whole length, finger tight on the mounting plate.
- b. Using an optical align and fix screws.
- c. When the first shaft is fixed correctly, mount the second shaft, align, and screw finger tight.
- d. Now assemble the carriage. Moving it along will pull the second shaft into alignment with the first one. (Fig. 3 & 4)
- e. When the second shaft is fixed the process is complete. Note however that, when using continuous shaft supports, the fixing screws should be tightened when the carriage is in the vicinity. Shafts with end supports should be tightened when the carriage is at the end being fixed. (Fig. 5)
- f. At this point another check can be carried out to ensure that the carriage is tracking as it should, i.e. that the edge of the carriage is moving parallel with the shaft. This can be done by means of a dial indicator, mounted on the edge of the carriage. When moving the carriage the indicated value should be within the stated tolerance. (Fig. 6)

Ordering Code

Ordering Code for Linear Housings:

SPM Linear Ball Bushing

Linear Ball Bushing, selfaligning

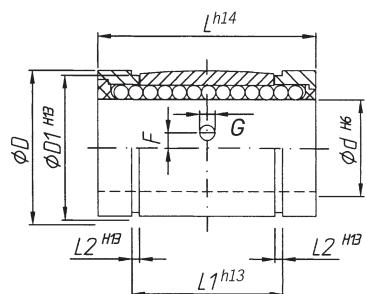

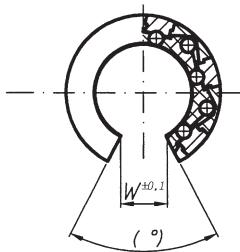

These bushings consist of a very precise injection-moulded plastic carrier with clipped-in runner plates. The plastic carrier also acts as a return track and for seal fixing. The seal is made of a special polyamide material with a low coefficient of friction. The twin-lip seal is clipped into the bushing.

These support rails are supplied completely assembled.
For dimensions please see the page describing the appropriate shaft support.
Any length can be supplied. If required lengths exceeds the maximum manufactured length,
rails will be supplied in sections to be assembled at the manufacturer.
The position of the first fixing hole can be selected by customer.
If no selection is made, the first hole will be at T/2.
Available support rails are tabulated below:

Shaft Ø	TSM with screw	TSH with screw	TSF with screw	TSFD with screw
12	WUM	M4x17	WUH	M4x20

An economic and proven solution to many linear bearing applications is the use of hardened and ground shafts (solid or tubular) offered in various materials and finishes, together with recirculating linear ball bushes, linear housings, shaft mounting blocks, continuous shaft supports. Our precision shafts are induction hardened. This ensures a constant degree of hardness along the ball-ways, as well as the rest of the shaft surface, in both the radial and axial direction. This induction process provides an effec-

tive hardened zone all over the shaft surface whilst leaving the core unhardened. This facilitates subsequent machining. The shafts are centerless ground and are then tested rigorously for straightness and roundness of the cylindrical form, as well as for surface finish. Please select the shaft-type best suited to your application.

The specification of our precision shafts is based on DIN ISO 13012-2:2010-02.

Selection criteria for solid or tubular linear bearing shafts

your special requirements	our type	material + finish	surface hardness	tolerance of outer Ø	sizes avail. Ø	see page

- other diameters and materials to be inquired

- * standardvalue, we reserve the option to deliver other inner-diameters depending on raw-material lots.

- ** depending on lots. the precision shafts up to Ø10mm can be throughhardened.

- The borderhardnessdepth is the depth, where the hardness is at least 80% of the surfacehardness.

Machined hardened and ground precision shafts

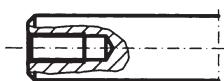

Please take advantage of our machining facilities, your overall costs will be lower if you use our "ready-to-install" precision shafts.

We specialise in machining induction hardened shafts. Using modern CNC machines we can supply finish-machined shaft units: eg: cyl. dias, chamfers, radial or axial drilled and tapped bores.

Machining examples

version 1AX – axial thread on one end

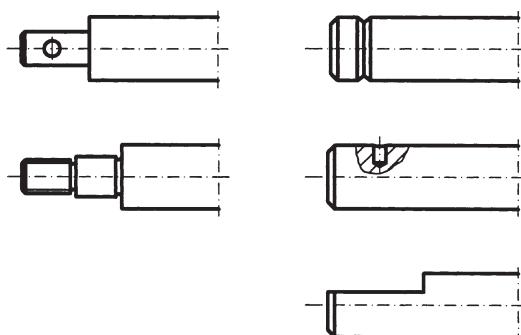

version 2AX – axial thread on both ends

version T1 or T2 – radial hole pattern T1 or T2

version Z – end machining per drawing

Shafts may be annealed depending on the hardnesszone and the required machining.

We will machine your shafts to your specification or drawing!

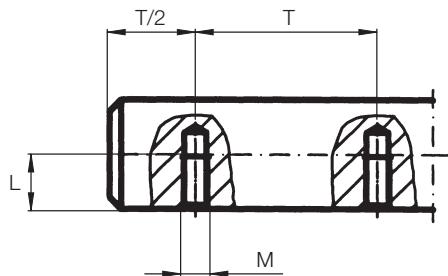

Standard machining options for Precision Shafts WV, WV1, WRS1, WRS2 + WH

Axial threads

option 1AX (axial thread on one end) / option 2AX (axial thread on both ends)

shaft-Ø, mm	thread	depth
8	M4	10 mm
10	M4	10 mm
12	M5	12 mm
14	M5	12 mm
16	M6	15 mm
20	M8	20 mm
25	M10	25 mm
30	M10	25 mm
40	M12	30 mm
50	M16	40 mm
60	M20	50 mm
80	M24	60 mm

For special threads, depth etc. please add the suffix "Z" instead of 1AX/ 2AX and indicate the specification.

Radial Hole Pattern

T1, T2, T3, Z (special, according to customer drawing)

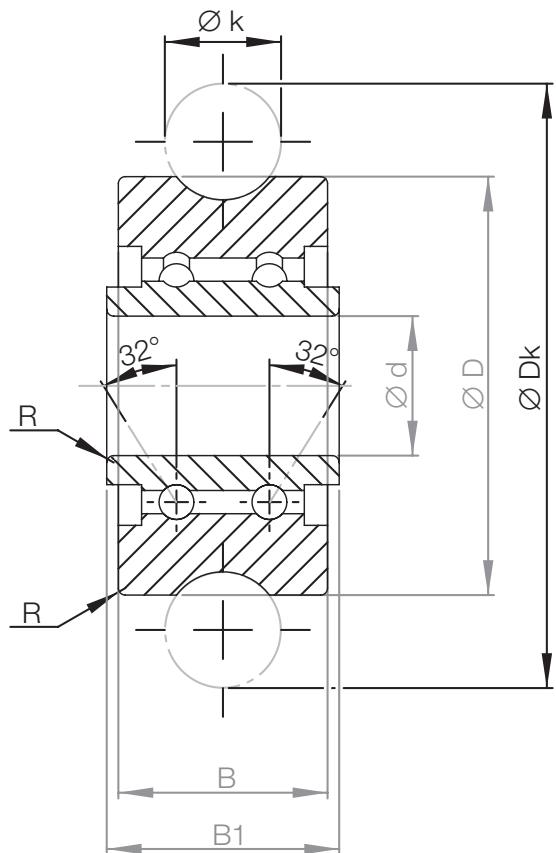

shaft-Ø, mm	M	L	T1	T2	T3
12	M4	8	75 mm	120 mm	75 mm
16	M5	9,5	100 mm	150 mm	75 mm
20	M6	13	100 mm	150 mm	75 mm
25	M8	14	120 mm	200 mm	75 mm
30	M10	18	150 mm	200 mm	100 mm
40	M10	20	200 mm	300 mm	100 mm
50	M12	23	300 mm	-	-

For special threads or hole patterns etc. please add the suffix "Z" instead of T1/ T2/ T3 and indicate the specification.
Sinking of the thread depending on the hardnessdepth of the shaft.

Ordering code

WV-	Ø 20-	h6-	2500-	T2-
material (WV, WV1, WRS1, WRS2, WH)	shaft diameter in mm	outside diameter tolerance please refer to page 76	shaft length	T1 T1-hole pattern T2 T2-hole pattern 1AX axial thread on one end 2AX axial thread on both ends Z per drawing/other specification

If no further requirements are made, all shafts will be chamfered, ca. 1x45°.

RODRIGUEZ® Trackrollers of the R-series are an interesting and economical addition to known linear guides. They can especially be used, in simple movements, when radial and slight axial forces are applied. Further they offer low noise performance, high speeds and continuous and low start- and running torques. Integration into existing and new machines can be realised easily. Centrical and excentrical pins are available.

available with motor, controller etc.

For more than 65 years Rodriguez® with its knowledge and expertise has been one of the leading suppliers worldwide of thin-section bearings, linear technology, precision roller bearings, custom bearings and components for various industrial applications. As technology progresses, the demand for the highest quality construction is greater than ever, resulting in the need for the best component selection, application engineering and customer-specific roller bearing technology. Due to their ability to meet these requirements, Rodriguez® delivers to the most important industrial sections, among

Driving technology

Automation

Printing machinery

Electronic

Automotive

Precision mechanics

Semiconductor industry

Wood working machinery

Plastic technology

Food industry

Aircraft and aerospace

Mechanical engineering

Medical devices

Testing equipment

Assembly

Optics

Robotics

Packaging technology

Machine tools

RODRIGUEZ® has realised very quickly that automatic repetitive motions require for more and more precise components. Customer objective and subsequently the consulting, research, development and manufacturing is the key qualification. Our belief is that only those who know the details are able to produce complex construction solutions. Therefore we have theoretically and practically elaborated the pre-conditions for a successful engineer consulting for all matters of roller bearings together with our partners.

And: Practised customer proximity and high flexibility are of course of the same value to us as a perfect customer service.
